The invention relates to the field of the metallurgy of steel, in particular hot and continuous casting in general and in particular to a procedure for treating steel for hot and continuous casting. Hot and continuous steel casting comprises generally, in addition to the production of metal, also a steel casting procedure with the steps of preheating the metal, preheating the mold and mold-filling, and, after a first cooling step, final cooling of the cast product. The necessary heat-up of the steel for the casting, which is needed for preheating, is generally supplied by a gas-fired burner, which is located in the furnace of the steel production line. The preheating of the mold and mold-filling can be achieved by a fluid heat medium, such as oil, water or steam. The final cooling of the cast product in general and the annealing step are performed using inert gas as a cooling medium, whereby the inert gas for the cooling is extracted from the casting shell, usually by means of an inert gas supply pipe, during the casting and thereafter the casting shell is cooled down further a1d647c40b

Click the "start" button. You will notice that you have the following menu: * CAD – Help – CAD Window * CAD – Help – Help Window * CAD – Help – Automation * CAD – Help – Maintenance * CAD – Help – Licensing Press the "cad" icon on the menu bar, to open the CAD window. There are three tabs on the CAD window: * "File" – Import and export cad-files * "Window" – The window of a cad-file * "History" – The history of the cad-file Make a note of the filenames of the cad-files you want to use. Navigate to the folder where you've stored the necessary files. You can now activate the template. There are two ways to activate the template. For "direct activation", navigate to the folder where you've stored the template and click the "start" button. If you have the AutoCAD 2009 version, you can use the "begin/end" feature on the tool bar and select "Maintain CAD Export". This will enable you to activate the template. If you have the AutoCAD 2012 version, you can use the "Catalog" function to activate the template. Press the "cad" icon on the menu bar, to open the CAD window. Navigate to the folder where you've stored the needed files. Right-click on the template in the list on the left hand side of the CAD window, and press the "Catalog" button. The result of the catalog will be to open a new tab in the window. You can now activate the template. Optimize your forms by using markup to specify fonts, spacing, orientation, and more. Choose from hundreds of predefined styles that provide all the information you need to update your forms quickly. (video: 1:21 min.) High-performance design applications: Inline Reflow: Use hot-key commands to easily create a control-driven design and visualize in real time the effect of any changes you make to your forms or your drawing. Bring up the Inline Reflow tool on any control and it automatically updates as you change a value. (video: 1:05 min.) Advance the process of designing control-driven applications by building a prototype in one drawing, then editing it directly on the form. (video: 2:11 min.) Draw Automation: Draw an array of shapes using the Draw operator and apply fills, strokes, and colors to many different shape collections. Create forms that update automatically based on the results of your calculations. (video: 1:27 min.) Transfer data from one drawing to another without using copy-and-paste. Copy objects in one drawing to the Clipboard, then transfer them directly to a drawing in a new file. (video: 2:14 min.) Relate objects with smart connectors that automatically update as you select objects and move them. Link objects with relational styles so they display side-by-side without having to copy and paste. Manufacturing: Drafting and printing: Draw printed sheets that can be used for two purposes: as a sample of your drawing and as a reference for a final version. The sample sheet can be annotated and saved so it's ready for future design changes. Or, keep it in a separate drawing for easy reference. (video: 1:42 min.) Automatically annotate drawings for manufacturing. Create a template that links the drawing to a final form or printable version that you can edit later. (video: 1:43 min.) Print sheets directly from a drawing. Annotate a drawing with required options or color values, then select multiple objects and print. The template lets you repeat the steps across multiple drawings. (video: 1:37 min.) Print sheets directly from your drawing.
