In contrast with other RPGs, the PvP aspect of the game is presented in a way that feels very exhilarating. ◆ A Mythic Drama

in Detail In the story, the various thoughts of the characters are intertwined and a magnificent drama is played out. Macrophage-mediated immunosuppression and cardiomyocyte injury. This

review focuses on the signaling pathways by which macrophages limit cardiomyocyte function. Because macrophages internalize extracellular material from the blood, they may play an important role in the pathogenesis of cardiac fibrosis. Macrophages also function as scavengers of lipids and oxidized low-density

lipoprotein, which may induce atherosclerosis. Macrophages also produce a variety of toxic compounds and enzymes that damage cardiomyocytes. For example, heme oxygenase-1 and interleukin (IL)-10, produced by monocytes/macrophages, inhibit the expression of voltage-gated sodium channels (Na(v)1.5) in cardiomyocytes, and both Na(v)1.5 and Na(v)1.8 are activated in response to the lethal levels of catecholamine that occur during the acute phase of myocardial infarction. Expression of Na(v)1.5 and Na(v)1.8 channels in cardiomyocytes significantly alters the resting membrane potential, which changes the action potential characteristics and eventually leads to arrhythmias. Macrophages also appear to participate in the induction of intracellular signaling pathways responsible for cardiomyocyte injury and death. Because experimental studies have shown that depletion of macrophages attenuates the damage induced by various oxidative stressors, macrophages appear to have a major role in the pathogenesis of cardiomyocyte injury during ischemia and reperfusion.
