Soluene to soon start laying its first cable on the bottom of the Sea Soluene, a French company that has been organizing diving expeditions since the 1960's, says it will soon start laying its first submarine cable on the bottom of the Mediterranean Sea. According to Agence France Presse the 27 kilometer long cable will reach Tunis and connect the Blue Mountains in the Mediterranean to the shore of France in Calais. A second cable along the same line is being planned. Soluene to soon start laying its first cable on the bottom of the Sea According to Soluene, the submarine cables are made of glass fibres, allowing them to withstand the high pressure and temperatures of the water. A high speed data transmission rate of 40 gigabits per second is being used for data transfer of pictures, videos and songs. The cables are equipped with an aerial that remains in place at the bottom of the sea and an anchor at the shore end. Soluene says that the first cable was laid in 2012. "The cables have already carried data for two years without a single interruption," according to the company. The project will cost €250 million, with €100 million of the financing already being provided by the European Investment Bank, €45 million coming from the French Agency for Development Finance and Foreign Trade (AFD), and €25 million from the French Development Agency. Soluene is also planning to lay another cable to link Italy's Corsica Island with a subsea terminal on the coast of the French Riviera. The company has organized more than 10,000 global adventure dives for blue marlin, manta rays, sharks, dolphins, octopuses and many other animals. North Korea Asked Why It Should Get Credit for the Denuclearization of the Korean Peninsula On Sunday, at a meeting of national officials in Pyongyang, North Korea's Foreign

As we can see from the above sample the screenshot is of kind of follows a standard pattern. we just need to extract the text in the form: [MapInfo Professional 11.5 17 Crack Portable MapInfo Professional Win7 [2012, RUS, X86, 2xCD].zip].[Name of the file here] A: for file in `ls *.zip`; do fileName=\$(basename "\$file".zip) text=\$(tail -n+2 "\$file" | grep -oP '\[(\S+)\]' | cut -d" " -f2) echo \$fileName \$(echo \$text | rev) done

Effects of three restorative materials on the bonding of Fuji II LC. The purpose of this study was to evaluate and compare the effects of three different adhesive restorative materials on the shear bond strength of Fuji II LC to enamel and dentin. Fifty-two extracted human molars were randomly divided into three groups (n = 16), and each was treated with one of the following materials: Adper Single Bond Plus (control group, Adper; n = 16), a dual-cure resin (Scotchbond Dual Cure,

SBC; n = 16) or a self-etch adhesive system (Clearfil SE Bond, CEB; n = 16). Specimens were exposed to the following surface treatments: Adper: sandblasting, 37% phosphoric acid etching and application of a bonding agent; CEB: a simplified stepwise adhesive procedure; and SBC: sandblasting and application of a bonding agent. Following adhesion, all specimens were restored with Fuji II LC cement, and the microshear bond strengths were determined after 24 h storage in distilled water (n = 5). The highest bond strength (11.7 +/- 1.5 MPa) was observed for the CEB group, while the lowest bond strength (7.4 +/- 2.4 MPa) was observed for the control group (p = 0.01). The Ce bond was significantly stronger than the Adper bond in enamel (p = 0.004) but not in dentin (p = 0.09). There were no statistically significant differences in bond strength between enamel and dentin. In conclusion, the adhesive self-etching system, Clearfil SE Bond d0c515b9f4

Traffic and transportation are national key issues that have received attention and. By November 2009 the new GIS features and supporting applications included. X 40 - 11.5-16 b. Hong Kong HIV antibody screening programme implemented in October 2002, prospectively followed a cohort of first-time blood donors. From September 2002 to August 2004, 2328 individuals who donated blood at one of the 22 blood centres in Hong Kong were assessed. Anti-HIV 1/2 antibodies were detected by enzyme-linked immunosorbent assay using Western blot confirmation. As a measure of HIV exposure, the median donation frequency was 17.4 per person-year (ranging from zero to more than 80) with the highest proportion (5.9%) of high repeat blood donors (more than 50 donations/year). Overall, the seroprevalence of HIV-1 was 5.6 per cent (14/253). Within one donation visit, the seroprevalence increased from 1.0 per cent to 4.3 per cent. For the anti-HIV-1 antibody positive donors, the median donation frequency was 16.5 per person-year, with a range of zero to more than 60. Similarly, the median donation frequency among the repeat blood donors was 17.8 per person-year. The proportion of HIV-1 glycoprotein 120 antibody (gp120) positive donors increased from 1.5 per cent to 4.3 per cent with increase in donation frequency. However, the proportion of gp120 antibody positive donors did not reach significance in any subgroup despite of a positive trend in high repeat blood donors ($p = 0.1-0.2$). These data indicated that the high prevalence of HIV-1 is mainly due to low-risk behaviour and sexual contact of the community. The community-based free screening programme for HIV antibody detection was well accepted by the donors and health care professionals. A new and distinct bourbon/bourbon-bourbon #1 (Kentucky) bourbon is the first alcohol beverage ever to be designated as an American Iced Tea by the United States Department of the Treasury. Pappy 15th Anniversary Rye features a deep mahogany red color with a strong, spicy-b
